1. Introduction

UK statistics on domestic overnight tourism have been collected in a broadly similar way since 1989, initially through the United Kingdom Tourism Survey (UKTS), and since 2011 through the Great Britain Tourism Survey by the three National Tourism Organisations of Britain. In 2020, the Day Visits survey was merged with the Overnight Trips survey into the Great Britain Tourism Survey (GBTS), covering both, overnight trips and day visits. This improved the comparability across both types of trips as there is one data collection approach and aligned methodology of data processing and volume and value estimates.

The GBTS: Overnight Trips is designed to measure the volume and value of domestic overnight tourism trips (covering all purposes of tourism such as holidays, visits to friends and relatives and business) taken by British residents, as well as collecting information about trip characteristics and trip takers. Domestic overnight tourism trips are those taken by British residents within England, Scotland, and Wales. A key purpose of the GBTS is to uncover insights into market trends over time.

In July 2024, a full methodological review was conducted, resulting in tightening, or adding a number of caps. The full 24 months, January 2022 to December 2023 data was then re-run using these new caps. This improved methodology was applied to the 2024 and 2025 overnight trips data also and this background quality report covers the approach.

The background quality report focusses on the current iteration of the GBTS: Overnight Trips, although some references are made to the previous iteration, where pertinent. This document will be updated on an annual basis, alongside the publication of the annual results. A separate background quality report is produced for the GBTS: Day Visits.

3. Statistical presentation

3.1 Data description

The GBTS: Overnight Trips provides monthly estimates of the volume and value of domestic overnight tourism, including the number of nights spent on overnight tourism. The survey measures both business and leisure overnight visits, and collects information on trip characteristics, such as the duration, mode of transport, type of accommodation stayed in, activities undertaken and reason for the trip, as well as information on the trip party composition. The results are produced monthly and are also aggregated to give quarterly, annual, and three-yearly estimates. Results are split by geography, purpose of trip and demographic factors.

In 2019 and earlier years the survey results were designated as official statistics. Due to the changes in methodology and the impact of the COVID-19 pandemic on tourism behaviour and the collection of data regarding tourism behaviour, 2020 was used as a pilot year, allowing for the new methodology to be tested and for additional analysis to be undertaken. For 2022-2025 the survey results have been labelled as statistics in development. The intention is to return to official statistics status in the future. Due to methodological and definition changes, 2022 data and beyond is not comparable to 2019.

3.2 Classification system

To qualify as an eligible overnight trip the following criteria must be met:

- Involved a stay of at least one night in Great Britain
- Not be taken on a frequent basis – this means it takes place less often than once a week

This aligns with the definitions of an overnight trip used by Eurostat.

For analysis purposes these trips are broken down by the main reason for the trip. The following classifications are used:

- GB Domestic Overnight Holiday Trips – the main purpose of the trip was for holiday, pleasure or leisure
- GB Domestic Overnight VFR Trips – the main purpose of the trip was for visiting friends and relatives
- GB Domestic Overnight Business Trips – the main purpose of the trip was for business
- GB Domestic Overnight for Overseas Trips – the main purpose of the trip was for an overnight stay in the UK as part of an overseas trip
- GB Domestic Overnight Miscellaneous Trips – the main purpose of the trip was for any other type of trip taken not covered by the other classifications

3.2.1 Geographical classifications

For geographical classification, standard GB regions and England subregional geographies are used, as defined by the Office for National Statistics. England also provide volume and value data at Local Visitor Economy Partnerships (LVEPs) level, please see [website](#) for details of this initiative. The nations of Scotland and Wales are further broken down into sub-regions:

Scotland:

- Scotland North – consisting of the local authorities of:
 - Aberdeen City
 - Aberdeenshire
 - Highland
 - Moray
 - Orkney Islands
 - Shetland Islands
 - Western Isles (Na h-Eileanan Siar)

- Scotland South – consisting of the local authorities of:
 - Dumfries and Galloway
 - Scottish Borders

- Scotland East – consisting of the local authorities of:
 - Angus
 - City of Edinburgh
 - Dundee City
 - East Lothian
 - Fife
 - Midlothian
 - Perth & Kinross
 - West Lothian

- Scotland West – consisting of the local authorities of:
 - Argyll & Bute
 - Clackmannanshire
 - East Ayrshire
 - East Dunbartonshire
 - East Renfrewshire
 - Falkirk
 - Glasgow City
 - Inverclyde
 - North Ayrshire
 - North Lanarkshire
 - Renfrewshire
 - South Lanarkshire
 - South Ayrshire
 - Stirling
 - West Dunbartonshire

Wales:

- Mid Wales – consisting of the local authorities of:
 - Ceredigion
 - Powys

- North Wales – consisting of the local authorities of:
 - Anglesey
 - Conwy
 - Denbighshire
 - Flintshire

- Gwynedd
- Wrexham
- South East Wales – consisting of the local authorities of:
 - Blaenau Gwent
 - Bridgend
 - Cardiff
 - Caerphilly
 - Merthyr Tydfil
 - Monmouthshire
 - Newport
 - Rhondda Cynon Taff
 - Torfaen
 - Vale of Glamorgan
- South West Wales – consisting of the local authorities of:
 - Carmarthenshire
 - Pembrokeshire
 - Neath Port Talbot
 - Swansea

3.3 Sector coverage

The survey is amongst members of the public and so sector coverage is not applicable in this case. However, it is worth noting that the statistics from the survey are used by businesses in the tourism sector, and those that are dependent on tourism.

3.4 Statistical concepts and definitions

Volume: An estimate of what the grossed-up number of overnight trips undertaken by the population, within the time period and other parameters specified, would be if the quota sample is representative of the whole GB population.

Value: An estimate of what the total expenditure relating to the volume of overnight visits undertaken by the population, within the time frame and other parameters specified, would be if the quota sample is representative of the whole GB population. Expenditure includes the cost of bookings paid in advance, other items bought for the purpose of the trip and payments for bills related to the trip received after the visit. Expenditure also includes any bills paid on the respondent's behalf, such as anything paid for by an employer for a business trip. Only fuel purchased during the trip is included. Only food consumed during the trip is included.

Bednights: An estimate of what the grossed-up number of nights spent on overnight trips undertaken by the population, within the time period and other parameters specified, would be if the quota sample is representative of the whole GB population.

Party composition: The number of adults and children in the immediate party that undertook each overnight trip.

Place stayed overnight: The name of the village, town or city visited, or the nearest village, town, or city. National Parks are treated as a place and can be selected from the list of places. Respondents are asked to select the 'main place' they visited and then any other places they visited. They are instructed to only include places where they stayed overnight.

Type of place visited: Respondent classification of the type of place visited into one of the following categories:

- City/large town
- Small town
- Village
- Rural countryside
- Seaside resort or town
- Seaside coastline – a beach
- Other coast
- Other

3.5 Statistical unit

Data is collected about the number of overnight trips taken by individual adults (aged 16+). A specific adult can have taken more than one overnight trip in the time period specified. Information is also collected about the presence of any children on these overnight trips, allowing estimations to be produced about adult and child trips, although children are not sampled.

The estimates of volume, value, and number of nights of trips presented are grossed-up to the total population of the geography in question (i.e. GB, England, Wales, or Scotland). This shows what the values, volumes and number of nights would be for the total population if the quota sample is representative of the whole GB population.

3.6 Statistical population

Adults aged 16+ resident in England, Scotland, and Wales. The survey also collects details of any children involved with overnight trips and these are included in the estimated grossed-up figures for volume, value, and number of nights.

3.7 Reference area

All respondents reside in Great Britain (England, Scotland, or Wales). Data is collected about overnight trips taken to places within Great Britain and Northern Ireland.

Great Britain does not include the crown dependencies of the Isle of Man, or the Channel Isles and no data is collected about trips to these areas.

Data collected about trips purely to Northern Ireland is not included in any of the reporting for GBTS, but it is shared with the Office for National Statistics so that it can be combined with data from an equivalent survey conducted by the Northern Ireland Statistics and Research Agency. If a trip involves an overnight stay in Northern Ireland and one or more locations within Great Britain, the information related to the places within Great Britain are included in GBTS reporting. As one of the ways to report GBTS data is split by characteristics related to the main place visited it is possible that a small number of trips may contribute to GB data without having a 'main place' within GB.

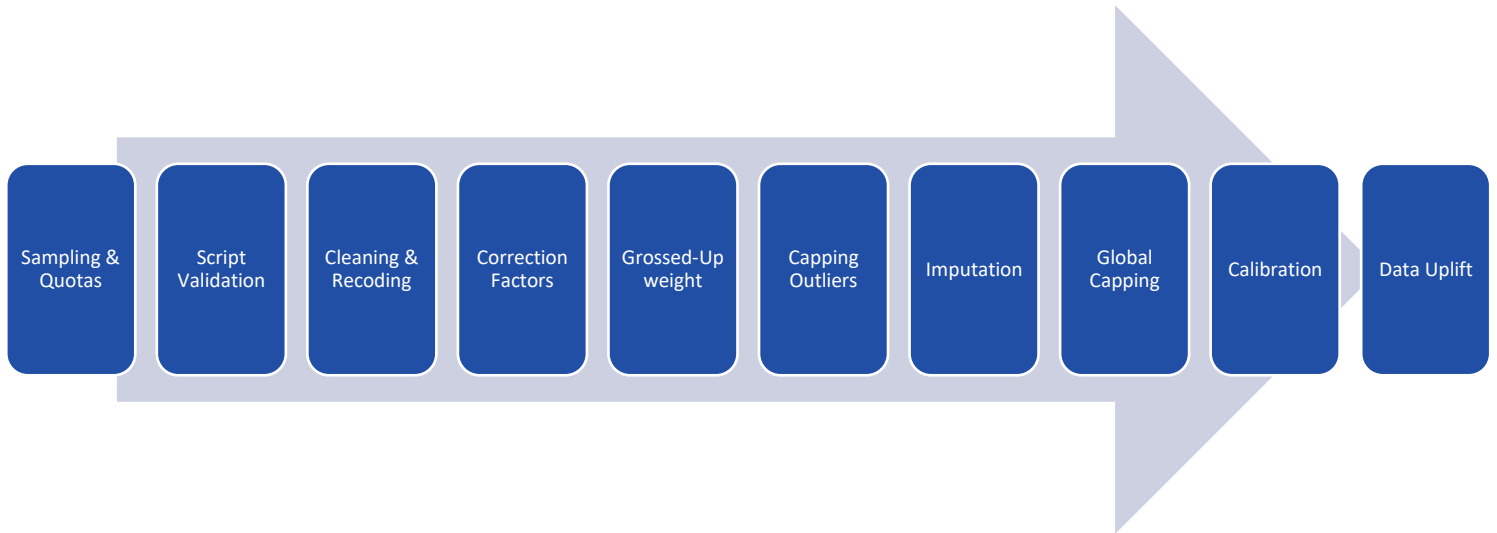

3.8 Time coverage

The statistics cover trips with a return date from the 1st of January 2025 to the 31st of December 2025. Older time series are described under 'comparability over time.'

3.9 Base period

This is not applicable.

4. Statistical processing

4.1 Source data

Data are based on a survey. The survey population is adults aged 16+ and residing in England, Scotland, and Wales. However, information is collected about any children present and so resulting estimations include adults and children.

4.1.1 Sample design

A non-probability method is used, with stratification by country (England, Scotland, and Wales) and quotas set within each country. The main reason for a non-probability approach is efficiency of data collection within the online methodology.

In general, probability survey methods are costlier and take more time to administer than non-probability methods. The cost of probability methods has also been increasing over recent years due to higher levels of non-response. If response rates are low, the potential for bias in the probability sample is higher. This is particularly the case if the profile of non-responders is systematically different to respondents.

While probability sampling allows for statistical techniques such as confidence intervals and margins of error to validate the results, this is not possible with a non-probability sample. However, indicative confidence intervals have been calculated using SPSS Complex Samples. This method applies a design-based approach that fully accounts for weighting, stratification, and survey structure. Variance is estimated using Taylor series linearisation, a standard method for producing reliable standard errors for complex, derived survey measures. These indicative confidence intervals provide the relative precision of the estimates, under the assumption that the weighted sample behaves like a random sample, while noting that they do not capture all potential sources of bias.

Quotas and weighting have been used to make the sample as representative of the GB adult population as possible within the confines of a non-probability sample. The survey sponsors weighed up the advantages of a probability sample against the disadvantages and made the decision that a non-probability sampling methodology better suited their needs and the available resources.

Government Social Research (GSR) guidelines on the reporting of results when quota sampling is used have been followed as much as possible, namely:

- The characteristics used to set quotas have been carefully considered. Additional work was undertaken in 2021 to investigate whether there is any potential bias in the sample collected, and if so, the magnitude of this bias. A key part of this analysis was to compare the collected sample to publicly available robust statistics to determine if any groups are under or over represented in the surveys. This analysis showed that the survey data is broadly comparable for presence of children in the household, ethnicity, level of education, car ownership, sexual identity, age (up to 75) and employment status.
- Interlocking quotas have been used where feasible. Age and gender quotas are interlocked, which account for the majority of quota cells
- The reporting, including this background quality report, sets out why quota sampling has been used
- The reporting, including this background quality report, sets out how the results should be interpreted

The GSR guidelines can be found here: [Quota-sampling-guidance-4.pdf \(civilservice.gov.uk\)](#)

4.1.2 Population

Information about the population comes from the latest available national statistics for each country. These are updated yearly. Population statistics come from 2 different sources:

- National [Census 2021](#) data for England and Wales and [Census 2022](#) data for Scotland.
- Statistics on the approximated social grade were sourced from the annual population survey produced by the ONS. The time period used was July 2018 – July 2019. These were the most recent available statistics at the time of finalising the sample spec. The statistics can be found here: [annual population estimates by the ONS.](#)
- As the National Statistics Socio-economic Classification (NS-SEC) is a harmonised standard in UK official statistics, for the purpose of quotas and weighting the population statistics for NS-SEC from the Annual Populations Survey are mapped to the approximated social grade collected in the GBTS. The ONS recommended considering whether the use of NS-SEC as a question set may be more appropriate. However, as NS-SEC requires at least 4 questions to be asked to be determined, it was agreed with the National Tourism Organisations that there is not sufficient space to ask NS-SEC in GBTS.

4.1.3 Sampling frame

- Data is collected through an online survey using a sample of individuals registered with online survey panels.
- Respondents are sourced via Qualtrics, an online platform that combines a number of ESOMAR accredited panel providers. A blend of 3 panels is used to mitigate against the risk of panel specific biases.

- Each of the panel providers have small biases in their total panel population. However, the use of quotas mitigates against this bias.
- The blend of panels is consistent for each month of fieldwork to ensure that the sample is stable. Due to underperformance of a panel, 1 of these panels was replaced with an alternative on 6th October 2021. This means that the panel composition is slightly different for data collected before 6th October 2021 and after 6th October 2021. In November 2023, one panel was replaced to support better targeting of harder to reach subgroups and age groups, such as 55+ age category. In September 2024, one panel took over the management of the other panels in a ‘aggregator’ model.
- A 3-month exclusion clause is used to ensure that no one individual respondent can complete the survey too frequently.
- Each panel has their own procedures, in line with ESOMAR guidelines¹ for ensuring the information they hold about each panellist is up to date and complete. Furthermore, all quota variables are collected within the survey to ensure that respondents are categorised appropriately.
- During the data quality review, Qualtrics identify and remove any respondents who are found to be duplicates across panels based on their IP addresses, location data (longitude/latitude), demographic data and respondent patterns. Furthermore, the panels perform their own deduping checks against the other three panels.

4.1.4 Quotas

The annual sample size is 60,000 respondents. This includes all respondents, whether they have taken a qualifying overnight trip or not. This 60,000 is split disproportionately by country, to allow for larger base sizes for analysis for Scotland and Wales:

- England – 42,000
- Scotland – 9,000
- Wales – 9,000

Quota sampling controls the composition of the final achieved sample ‘by design.’ In quota sampling targets are set for each quota category and once this target has been reached, no further interviews in that category are collected.

The quotas are set based on national statistics about the GB adult population, as described above (under ‘population’ in section 4.1.2). Respondents in Scotland and Wales are oversampled to ensure the resulting base sizes allow for robust analysis. Within each country quotas are set on age x gender (interlocking), approximated social grade and English regions.

¹ [The ICC/ESOMAR International Code](#)

Hard quotas are set for each 4 weeks of interviewing, as below:

REGION	%	Overnight trips target		Age/Gender	%	Overnight trips target
England	70%	3232		Male 16-24	7%	314
Scotland	15%	692		Male 25-34	8%	388
Wales	15%	692		Male 35-44	8%	356
Total	100%	4,616		Male 45-54	8%	388
East Midlands	6%	279		Male 55-64	7%	336
East of England	8%	357		Male 65+	10%	477
London	11%	505		Female 16-24	6%	297
North East	3%	156		Female 25-34	8%	384
North West	9%	421		Female 35-44	8%	361
South East	11%	527		Female 45-54	9%	399
South West	7%	330		Female 55-64	8%	348
West Midlands	7%	339		Female 65+	12%	569
Yorkshire and the Humber	7%	317		Approximated social grade		
Total	70%	3,232		AB	14%	664
				C1	36%	1673
				C2	28%	1271
				DE	22%	1,008

Quotas are monitored on a weekly basis to ensure they are achieved as evenly as possible across each 4-week or 5-week period.

4.2 Frequency of data collection

Data collection is carried out throughout all four or five weeks of a given month. Data is reported on a calendar month, quarterly and yearly basis. Some analysis also uses a rolling 12-month period, year-to-date, 2-year average and 3-year average classifications.

Each respondent is asked about any overnight trips they have taken in the 4 full weeks prior to their date of interview, e.g. if an interview is completed on Wednesday 6th August 2025, the respondent will answer about overnight trips taken between 7th July 2025 and 3rd August 2025. Following the methodological review, data is now reported by calendar month, assigned by trip end date.

4.3 Data collection

Data collection is online, via Qualtrics, an online platform that combines a number of ESOMAR accredited panel providers. The survey is device agnostic, meaning that respondents can complete on a desktop PC, laptop, tablet, or mobile device.

Data collection for the overnight trips survey is combined with collection for the day visits survey.

The script has 5 sections (the full questionnaire can be found in the appendix of this document):

1. Quota demographics
2. Universe trips
3. Overnight trips
4. Day visits
5. International trips
6. Final demographics

All respondents are asked sections 1, 2, 5 and 6. Allocation to sections 3 and 4 is determined by the script on a least full basis, after section 1 has been completed, but before any data is collected for section 2. This means that a respondent can be allocated to the overnight trips section, even if they have not taken any qualifying overnight trips in the reference period. In such a case the respondent would be asked sections 1 and 2, and then skip to section 5. This ensures that the sample is not biased by responses to the universe section.

4.3.1 Testing of data collection procedures and systems

As part of the set-up of the GBTS survey the script was thoroughly tested to ensure that all of the routing and data validation aspects were working as desired. A live pilot was also conducted to allow the scripts to be fully tested. The pilot took place between 23rd April and 20th May 2020. 3,126 pilot surveys were completed for overnight trips.

4.3.2 Checks applied at data entry stage

As the survey uses an online methodology all of the checks at data entry stage are built into the survey script. The following checks are in the questionnaire:

- Q003 – place of residence – respondents must select from a drop down list containing 61,442 cities, towns and villages in the UK
- Q005 – respondent’s age – any respondents aged 15 or under are automatically screened out of the survey
- TS05a – number of nights spent on trip – respondents must enter a whole number between 1 and 364.
- TS07 – main place visited – respondents must select from a drop down list containing 61,442 cities, towns and villages in the UK.
- TS10 – number of other places stayed – respondents must enter a whole number between 1 and 99
- TS11 – other places visited – respondents must select from a drop down list containing 61,442 cities, towns and villages in the UK
- TS15 – nights spent at other places – respondents must enter a whole number between 1 and 99 for each other place visited. If the total number of nights entered is greater than the value entered at TS05a an error message is displayed that asks them to check and edit the figures they have entered
- TS21 – party size – a maximum of 50 is allowed for each type of party member
- TS30a – party size that the respondent is giving spend information for – respondents are not able to enter a greater number of adults or children here than entered at TS21. If they do an error message is displayed that asks them to check and edit the figures they have entered
- TS31 – spend on package – If the amount entered is greater than £5,000 a warning message is shown: “You said that you spent more than £5,000 on the package, please check that this is correct”. The respondent is allowed to proceed with zero spend, or with a spend of greater than £5,000, as these are both possible scenarios.
- TS32 – spend on non-package elements of trip – if zero is entered for all spend categories a warning message is shown: “You have said that you didn’t spend anything on your trip. Is this correct? If not, please change your answers”. The respondent is allowed to proceed with zero spend, as this is a possible scenario.
- TS32 – spend on non-package elements of trip – if a value greater than £5,000 is entered for any of the individual spend categories a warning message is shown to the respondent: “You entered more than £5000 for an item. Is this correct? If not please change your answers”. The respondent is allowed to proceed with a spend greater than £5,000, as this is a possible scenario

As the survey is online the script is designed so that a respondent cannot continue to the next question unless a response is given. Most questions, however, have a ‘don’t know’ option to ensure that each respondent can answer truthfully. The procedure for ‘don’t know’ responses is detailed in sections 4.4 and 4.5.

4.4 Data validation

Data is downloaded from the Qualtrics survey platform on a monthly basis. Many checks on the data are performed via an automated rules-based system. However, in the first two waves of fieldwork all of these automated checks were manually double checked to ensure that they were working correctly.

The process for data validation follows 6 key steps:

1. Removing any respondents with ineligible responses, such as the combination of age and level of education, or have a large amount of missing data. Automated rules are used to flag and reject any records that do not meet minimum standards. The number of rejected records are monitored on a monthly basis.
2. Removing any respondents who give ineligible visit information, such as saying they returned from multiple overnight trips on the same date.
3. Recoding 'don't know' responses to missing for certain questions (mainly associated with spend). These missing values are then dealt with through the imputation process detailed in 4.5.
4. Converting data from the spend questions to a 'per adult equivalent' spend so that data validation rules and caps can be applied on a like-for-like basis. For the purpose of these calculations we count child spend as half an adult, so we divide the reported spend by an 'adult equivalent' by the total of those reported on [number of adults + 0.5 * number of children reported on]. More information on how spend data is treated can be found in section 4.5.3.
5. Caps and recoding are then applied to the 'per adult equivalent' spend data:
 - a. Caps on certain variables to reduce the impact of outliers when users are drilling down to smaller subsets of the data
 - b. Recoding zero spend values to missing where there is sufficient reason to believe spend would have occurred
 - c. Imputing any missing values with median per adult equivalent spends for that month
6. Caps and recoding on party size and number of places visited to limit the impact of outliers when users are drilling down to smaller subsets of the data. Set rules are used for when data is capped and the level it is capped at (described in 4.5.1).

It is important to note that where an amount is entered by a respondent, that amount is only ever capped, it is never recoded to missing or imputed. The purpose of the caps is to reduce the impact of outliers when data is analysed, particularly at a subgroup level.

The number of records that are capped or removed for being ineligible are monitored on a monthly basis and are reported in this document under 4.5.

4.5 Data compilation

4.5.1 Caps and imputations

As described in 4.4, caps and imputation occur in 3 instances;

1. when 'caps' are implemented on data (to minimise the impact of outliers),
2. when missing data is replaced (to ensure robust data and therefore data quality), and
3. when zero spend data is replaced (when there is sufficient reason to believe spend should have occurred)

Where missing spend data are replaced a two-step process is used:

- A proportion are assigned a zero value. This proportion is determined by the proportion of valid trips that have a zero value, i.e. if 10% of valid visits have a zero response, 10% of missing cases are assigned a zero response
- The remaining missing trips are assigned the non-zero median value of the other trips within that month

The caps and imputations applied are summarised in the table below.

Variable/ Section	Focus Area	Cap / Rule Applied	Notes / Conditional Logic
TS05	Total Nights	Capped at 21 nights for general trips.	Limits impact of unusually long trips. Specific Cap: If main purpose is overnight UK stay as part of a trip abroad (OT3=4), capped at 4 nights (allows 2 before / 2 after travel).
TS11	Names of other places visited	Exact duplicate entries adjusted to 1.	Assumes respondent misread question and only visited one location.
TS15	Number of nights per place	Proportionally adjusted.	If the total number of nights is capped at TS05 responses to TS15 are proportioned out to the total capped number of nights.
TS21	Party composition	Spouse/Partner capped at 2.	Assumes values >2 are data input errors
TS21	Party composition	Missing child count imputed.	If TS20 indicates a child but TS21 is empty, variable is set to missing and imputed with the non-zero median of children for that trip type (OT3).
TS21	Party composition	Missing adult count imputed.	If TS20 indicates another adult but TS21 is empty, variable is set to missing and imputed with the non-zero median of adults for that trip type (OT3).
TS21	Total Party Size	Capped at 10 adults and 10 children.	Unless TS23 indicates a larger group. Pulls through to total volume, spend and bednights.
TS21	Total Party Size	Capped at 70 total (Large Group).	Applied if TS23 indicates a larger group. Reduces outlier impact.
Total Trip Spend*	Overall Spend	Capped at £3,499 per record.	2025 adjusted cap (up from £3,000 baseline in 2022)*.

Variable/ Section	Focus Area	Cap / Rule Applied	Notes / Conditional Logic
TS31	Package Spend	Capped at £1,750 per adult equivalent/night.	If "don't know" is selected, zero values are replaced with non-zero median for this category (since TS25 already confirmed a paid package).
TS32_1**	Accommodation Spend	Capped at £817 per adult equivalent/night	If "don't know" is selected, TS26 ≠1, TS16b=1, and it's a paid commercial type**, replace with non-zero median.
TS32_2***	Travel Costs	Capped at £643 per adult equivalent/night.	Covers transit to/from/during trip. If "don't know", TS26 ≠2, and paid transport type***, replace with non-zero median.
TS32_3	Services/Advice	Capped at £234 per adult equivalent/night.	
TS32_4	Eating/Drinking Out	Capped at £583 per adult equivalent/night.	
TS32_5	Eating/Drinking In	Capped at £583 per adult equivalent/night.	Spend on eating/drinking within accommodation.
TS32_6	Other Shopping	Capped at £700 per adult equivalent/night.	
TS32_7	Entertainment	Capped at £583 per adult equivalent/night.	
TS32_8	Anything else	Capped at £351 per adult equivalent/night.	
Weights	Respondent Weight	Capped at 4.	
CTCF	Child trip correction factor	Capped at 4 (Standard) or 6 (Large Group).	Divides trip party children by trip party adults.
CSCF	Child spend correction factor	Capped at 2.	
Missing Trip Details		Impute essential variables only.	• TS07 (Country) : Randomly assigned (England, Scotland, Wales).

Variable/Section	Focus Area	Cap / Rule Applied	Notes / Conditional Logic
	Qualifying trip taken, but zero detail provided		<ul style="list-style-type: none"> • TS05 (Nights): Imputed with reporting period median. • TS21A_1 (Party Adults): Imputed with reporting period median. • TS21A_2 (Party Children): Imputed with reporting period median. • NUM_AD_SPEND: Imputed with reporting period median. • NUM_CH_SPEND: Imputed with reporting period median. • Trip Correction Factor: Set to equal number of eligible trips taken. • The per adult equivalent per night spend imputed with reporting period median. • Places visited: Set to 1.

* Inflation adjustments based on ONS CPIH December 2022 figures (2023: 9.2%, 2024: 4.2%, 2025: 2.5%).

**Expected Paid Accommodation Types: Hotel/Motel/Inn, Serviced apartment, B&B/Guest house, Farmhouse, Rented flat/house/cottage/cabin, Static caravan (not owned), Glamping/Yurt/Tipi, Commercial room/property rental, Hostel, Boat/Cruise ship, Train, University/School.

***Expected Paid Transport Types: Hired/rented car, Train, Public bus/coach, Organised coach tour, Taxi, Tube/Underground, Tram, Plane, Boat/Ferry/Canal boat.

Non-zero medians are calculated each month and take into account all valid trip takers. During the set up and pilot phase in 2020 the use of imputation classes, using homogenous groups, such as all takers of a certain type of trip, were explored but were discounted for a number of reasons:

- The resulting bases sizes, particularly for 2020, 2021 and early 2022 when trip taking behaviour was constrained by COVID-19 restrictions, do not support breaking the responses into meaningful groups. There are too many different types of trips to give reliable base sizes to calculate non-zero medians for homogenous groups.
- For example, in September, the month with the highest number of qualifying trips in 2020, 639 trips qualified as GB Domestic Overnight Holiday Trips. 7 of these trips were zero spend, so the remaining 632 are used to calculate the non-zero median.

- However, if this 632 is broken down by the main activity undertaken on the trip (the variable that is likely to have the biggest impact on per adult equivalent spend) there are some activity categories with disproportionately small numbers:
 - Holiday taken in the UK – 335
 - Visiting friends or relatives in the UK – 171
 - Business trip in the UK – 31
 - Overnight stay in the UK as part of an overseas trip – 32
 - Other type of trip taken in the UK - 63
- Demographic or location-based groups were also considered, but similarly, the resulting base sizes did not permit this within each month
- It was considered whether a period of longer than a month could be used to determine the non-zero medians. However, due to seasonal variation in spend, in particular linked to school holidays this was discounted
- If imputation classes were used it would result in greater variability in non-zero medians and they would be more susceptible to outliers, meaning a greater risk of imputation skewing results

The vast majority of the imputation that takes place is for spend data and is done so because respondents have stated that they do not know how much was spent on their trip. If values were not imputed for these trips the resulting spend calculations would incorrectly assume that all of the trips where 'don't know' has been selected in fact had zero spend. This would be incorrect, as we know from other trips that spend does indeed occur and would result in much lower estimations of total spend overall. Therefore, imputation is used to minimise the impact of these 'don't know' responses.

Volume, spend and bednight caps were updated for 2022 and 2023 as part of a wider methodological review undertaken in July and August 2024 to manage the impact of unusually large trips or spend. Analysis was conducted in 2022 and 2023 data to assess the impact of these outliers, some of which accounted for up to 30% of monthly spend or volume for a nation in a particular month. Following this analysis, the below caps were agreed and applied, thus reducing the impact of any outlier trips. These caps are also applied to the 2025 data. Each month there are a handful of outliers, meaning that a very small percentage of overall trips are impacted. (See caps and imputations table on pages 19-21 for details).

Caps are applied to monthly data for each nation. England has a lower percentage cap due to the larger sample size.

- England – cap any trip that is greater than 2% of capped and weighted spend value filtered to England at 2%. Cap any trip that is greater than 1% capped and weighted volume filtered to England at 1%.

- Scotland – cap any trip that is greater than 4% of capped and weighted spend value filtered to Scotland at 4%. Cap any trip that is greater than 2% capped and weighted volume filtered to Scotland at 2%.
- Wales – cap any trip that is greater than 4% of capped and weighted spend value filtered to Wales at 4%. Cap any trip that is greater than 2% capped and weighted volume filtered to Wales at 2%.

To calculate bednight caps, the percentage change between the original volume score and the capped volume score is calculated and the bednights score is then reduced by this same amount. This ensures that the changes between volume and bednights is proportional.

Capping at 2% volume for Scotland and Wales means that the trip files need to have a base size over 75 trips per month, otherwise a large proportion of the records will be meeting the cap. Average capping was implemented in 2024 to ensure smaller monthly base sizes would be accounted for, increasing and decreasing the cap with the size of the trip files. Average capping calculates the average (divide the volume by number of trips), multiplies it by 1.5 and checks which is greater, the 2% cap or the average cap figure. The greater cap is applied.

Imputation has its limitations. It assumes that all trip takers who did not give spend information had similar per adult equivalent per night spends, when we know that spend differs considerably for each trip taken. It also assumes that a similar proportion of trip takers who did not give spend information actually had zero spend as those who did provide spend information. However, the imputation approach aims to balance these limitations against the impact of no imputation.

The impact of the caps and imputations is expected to be very low. They are applied only in cases where it can be reasonably assumed that an error has been made at the data entry stage by the respondent or where no data has been given by the respondent. As such the cap levels are set considerably above the average spend per night (typically between £50 and £80).

In 2025, the following number of caps and imputations were performed:

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total
Edits to correct for:													
Inconsistencies in party size*	5	8	6	3	13	2	2	7	13	16	20	13	108
'Don't know' being entered for party size*	4	3	4	1	8	1	0	6	8	12	14	9	70
'Don't know' being entered for whether they were accompanied on trip	2	0	3	3	4	2	1	3	3	5	7	7	40

Not entering an accommodation price (but stayed in paid for accommodation in certain categories)	17	17	17	18	14	11	13	17	28	37	36	35	260
No spend on travel (although have used forms of transport that usually has a cost)	22	19	20	9	12	17	11	19	25	34	34	41	263
Caps for number of nights:

Wales volume	14	5	8	10	8	5	3	16	10	10	3	5	97

*This figure represents the number of edits, rather than the number of trips that were edited. This is because there are separate edits for adults and children in the trip party. The actual number of trips edited will be lower than the number given.

4.5.2 Weighting

Weighting involves re-balancing survey data to more accurately reflect the population.

Post-stratification weighting is used for GBTS to adjust the achieved sample to the known population. It is also used to correct for the oversampling of respondents living in Scotland and Wales. Weighting adjusts the results so that weighted totals on a number of key variables agree with known proportions in the population of non-overlapping, mutually exclusive cells.

For GBTS grossed up weights are used. A multiplier is applied to responses so that an indication of what the results would show if the quota sample was representative of the whole population can be calculated.

Grossed-up weights are determined by the sample cells and the population figures, and are applied to all qualifying interview records, including zero-trip respondents. The weighting scheme applies rim weights as follows:

- Gender (male/female) and age (16-24, 25-34, 35-44, 45-54, 55-64, 65+) interlocked – 12 cells
- Region (standard 11 GOR; East Midlands, East of England, London, North East, North West, South East, South West, West Midlands, Yorkshire & the Humber, Scotland, Wales) – 11 Cells
- Approximated social grade (AB/C1/C2/DE) – 4 Cells

This results in a weighting matrix incorporating 528 cells.

The weighting scheme differs from that used for previous versions of GBTS. In 2019 and earlier, the weighting scheme (devised by the incumbent fieldwork agency) also incorporated car ownership and presence of children in the household. It also had additional cells for age (75-84 and 85+) and social grade (D and E were separate cells). As such it resulted in 5,280 weighting cells. The decision to reduce the weighting criteria, and therefore the number of cells was taken to improve the weighting efficiency. Simplified weighting schemes tend to have less impact on the data than more complex ones, so the effect of weighting is 'lighter' and weighting efficiency is higher, thus leading to greater accuracy through lower sampling variance, standard deviation, and standard error. Given that analysing small subsets of the data is an important element of GBTS it was agreed that the weighting efficiency should be improved in this way.

Analysis was conducted on previously collected data (from the 2018 survey) to determine the likely impact of this change in weighting criteria. The analysis used 65+ as the upper age group and so resulted in 528 weighting cells. This analysis, although constrained by the data available, estimated that the change impacted the volume of visits by +2.0%, the volume of bednights by +3.5% and the value of overnight trips by +1.8%.

As mentioned in section 4.1.2, for the purposes of weighting, the population statistics for NS-SEC from the Annual Population Survey are mapped to approximated social grade. It is not possible to calculate the level of accuracy of this mapping as the question used to derive approximated social grade and the set of questions used to derive NS-SEC are not asked in any one survey together. However, the fact that the population statistics are mapped to approximated social grade before they are used introduces some statistical error. The magnitude of this statistical error is not known, but it is possible that it may disproportionately impact individual social grades.

4.5.3 Derived variables and correction factors

Once the weighting has been applied there is one respondent-level correction applied, called the partial reporting factor.

The partial reporting factor accounts for the fact that results are reported on a calendar monthly basis, but that each respondent is only asked about the overnight trips that they undertook in the previous 4 weeks for reporting purposes each reporting month consists of whole month reporting consisting of either 8 or 9 weeks of fieldwork. As respondents are asked about trips, they have taken over a 4-week period, in most cases they are answering about two different reporting periods and are not asked about any full reporting period. For example, if a respondent were to take the survey on 20th February 2025, they would be asked about trips that they took between 20th January and 16th February. This means that they have been asked about trips taking place in 12 days in January 2025, and 16 days in February 2025.

As these respondents haven't had the opportunity to tell us about any trips for the first 3 weeks in January or the last week in February, we apply a correction factor called the 'partial reporting factor' (PRF). This assumes that their pattern of trip taking was similar for the weeks that they were not asked about in January and February as it was for the weeks they were asked about in these months. It is essentially a multiplication factor that replicates their trips for the weeks within the reporting period in question they were not asked about.

However, the proportion of a month that a respondent has had the opportunity to tell us about differs depending on the week that they take the survey. As the survey aims for the same number of interviews every week, rather than calculate an individual PRF for each respondent, we can calculate an average one for the month. Using an average, rather than individual PRFs helps to smooth out the impact of any outliers and so means they don't have a disproportionate impact on the resulting estimations. The partial reporting factor adjusts for the number of respondents who completed survey's each week, and monthly PRF in 2025 ranged from 1.91 to 2.28.

The PRF by month, for 2025, are as follows:

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2.03	1.94	2.28	2.00	2.02	2.22	2.07	1.96	1.91	2.02	2.00	2.00

Once the respondent-level correction factors have been applied the respondent level file is converted into a trip level file. In this file each reported trip is given its own record, with the respondent specific information (such as demographics, weight and the trip correction factor and partial reporting factor) duplicated.

Two trip-level correction factors are then applied:

- Child trip correction factor
- Child spend correction factor

The child trip correction factor accounts for children, as they are excluded from the sample (data is only collected from adults aged 16+). Each child is 'shared' across the number of adults in the trip party. The child trip correction factor is calculated by dividing the number of children in the trip party by the number of adults in the trip party. The child trip correction factor is capped at 4 for an average trip and capped at 6 for a larger group.

The child spend correction factor accounts for the fact that a respondent can include spend on behalf of a child in the spend data that they provide. Each child is allocated half of the spend of an adult (as the price of a child is often half of that of an adult on aspects such as transport and entrance fees) and each child is 'shared' across the number of adults in the trip party. The child spend correction factor is calculated by $0.5 * [\text{number of children/number of adults}]$. The child spend correction factor is capped at 2.

In 2021 additional work was undertaken to consider whether the assumption that spend on a child is half that of an adult is robust. This analysis used 2020 survey data. The analysis showed that in 2020 spend on each additional child was 40.8% of spend on each additional adult.

4.5.4 Calibration

Calibration of 2022-2025 data

In 2024 a full methodological review was conducted, which resulted in tightening or adding a number of caps. The full 24 months, January 2022 to December 2023 data was then re-run using these new caps.

These caps helped manage the variability of the data, due to smaller base sizes, at the monthly level. However, capping the data meant that the trips, bednights and spend statistics were artificially reduced for Wales and Scotland. England was not capped as heavily as the base sizes are much larger and outlier trips don't have the same impact.

It was agreed that a calibration factor would be applied to the data to return trips, bednights and spend values back to the original, pre-methodological review figures. This ensured that the new caps reduced volatility in the data, but did not artificially reduce estimates in doing so.

The calibration factor was calculated from the difference between the pre-review and post-review statistics and applied as follows:

Single nation trips

England only trips, nights and spend are calibrated as per the figures below. GB to match this figure.

	Trips	Nights	Spend
ENG	97.95%	100.04%	99.56%

Scotland only trips, nights and spend are calibrated as per the figures below. GB to match this figure.

	Trips	Nights	Spend
SCOT	102.61%	106.10%	106.03%

Wales only trips, nights and spend are calibrated as per the figures attached. GB to match this figure.

	Trips	Nights	Spend
WAL	109.15%	109.37%	109.95%

Multi nation trips

Multi nation trip used a calibration factor for each nation and used below GB calibration factor for GB trips.

	Trips	Nights	Spend
GB	98.83%	N/A	N/A

Multi nation bednights and spend applied a calibration factor to each nation. For GB, added multi nation calibrated bednights and spend together to establish GB calibrated bednights and spend. GB does not have its own calibration factor.

The calibration factors have been applied to the 2025 data and will be applied during all data processing in the future, to ensure comparability.

4.6 Adjustment

Two adjustments were applied to the data in 2025 due to JavaScript² issues in the survey. While JavaScript is essential to the functionality of more complex surveys, a proportion of respondents (usually quite small) may have issues completing the survey. In Q3 2025, the proportion of JavaScript fails increased, requiring an uplift to the data. In Q4, the resolution of a specific JavaScript question issue required a comparability adjustment to maintain the time series.

4.6.1 Data Uplift

During fieldwork for July and August 2025, scripting issues caused a higher-than-average number of respondents to be removed from the survey. This led to artificially lowered estimates across the GB nations. As it was not possible to recover data, uplifts were applied to overnight trips.

The uplifts were calculated by assessing how many trips by age x gender, region and social grade would have resulted in a legitimate trip in the trip file. For example, for July trips, the date of the interview was between 7th July and 31th August and the respondent took an overnight trip, less often than once a week, between 1st July and 31st July.

Data Uplift Percentage by Demographics

Age Gender	Jul-25				Aug-25			
	Trips in Trip File	Trips missing due to JS	Total	% of Total	Trips in Trip File	Trips missing due to JS	Total	% of Total
M16-24	43	6	49	14%	47	2	49	4%
M25-34	76	10	86	13%	102	11	113	11%
M35-44	62	8	70	13%	75	6	81	8%

² JavaScript is a programming language that makes websites interactive, such as enabling buttons and forms to work, however, it cause surveys to behave incorrectly for a small proportion of respondents if it is disabled or not fully supported in their browser.

Great Britain Tourism Survey: Overnight Trips 2025

M45-54	46	1	47	2%	36	3	39	8%
M55-64	20	2	22	10%	45		45	0%
M65+	15		15	0%	17		17	0%
F16-24	44		44	0%	72		72	0%
F25-34	87	2	89	2%	116	2	118	2%
F35-44	56	2	58	4%	93	3	96	3%
F45-54	44		44	0%	54		54	0%
F55-64	29	1	30	3%	41	1	42	2%
F65+	12		12	0%	16	1	17	6%
SEG								
AB	140	12	152	9%	179	9	188	5%
C1	203	8	211	4%	291	5	296	2%
C2	117	8	125	7%	161	12	173	7%
DE	74	4	78	5%	84	3	87	4%
Region								
East Midlands	26	1	27	4%	48		48	0%
East of England	53	1	54	2%	48	2	50	4%
London	71	10	81	14%	107	10	117	9%
North East	19	4	23	21%	28		28	0%
North West	52	5	57	10%	53	3	56	6%
Scotland	100	5	105	5%	98	3	101	3%
South East	39	1	40	3%	69	3	72	4%
South West	39		39	0%	53		53	0%
Wales	69	4	73	6%	89	4	93	4%
West Midlands	36		36	0%	62	4	66	6%
Yorkshire and The Humber	30	1	31	3%	58		58	0%
Total	534	32	566	6%	713	29	742	4%

The uplifts were applied to the final data, following weights, capping and calibration.

4.6.2. Comparability Adjustment

Nature of Change

Prior to October 2025, a technical issue within the survey, linked to JavaScript at an early stage of the questionnaire (OT1³) prevented some respondents from completing the survey after indicating that they had taken an overnight trip.

These incomplete responses were automatically replaced through the quota system, introducing imbalance in the achieved sample.

Following the resolution of the technical issue, there was a shift in the reporting patterns for overnight trip volume, bednights and expenditure. To maintain the long-term integrity of the time series, a methodological adjustment was applied to Q4 2025 data to harmonize the period before and after this update, while preserving the overall robustness and representativeness of the survey outputs.

Correction Factor Approach

The calibration adjusts the data to reflect the proportion of respondents who would have completed the survey in the absence of the JavaScript issue. The adjustment is made at the OT1 level, where the issue occurred, ensuring that the balance between trip takers and non-trip takers is consistent over time.

In practical terms, the approach estimates the number of respondents lost due to the issue, reconstructs the expected distribution of trip and non-trip responses, and applies correction weights to reflect this distribution. These weights are applied at the individual respondent level, allowing the adjustment to flow through consistently to all outputs and subgroups.

A key element of the methodology is the treatment of respondent replacement. Because respondents who dropped out were replaced with new respondents, who could themselves also drop out, the process effectively created an iterative cycle throughout fieldwork. To account for this, a convergent geometric series is used to estimate the underlying population proportions that would have been observed had the issue not occurred. This provides a robust basis for reconstructing the true level of trip incidence and deriving the calibration weights.

Correction Factors

Correction factors are derived by comparing the estimated underlying trip incidence with that observed in the data. These are calculated separately for respondents who reported taking a trip (OT1 = Yes) and those who did not (OT1 = No), and applied as adjustment weights.

A range of approaches were considered, including monthly, average and quarterly methods. The final approach adopts a quarterly, region-based framework. This provides a pragmatic balance between stability and sensitivity,

³ OT1 is a question in the universe of trips section of the survey - 'Have you returned from any trips that have involved an overnight stay in the UK away from home in the past 4 weeks (e.g. between [INSERT DATE 2] and [INSERT DATE 1])?'

reducing volatility while still capturing seasonal variation and regional differences. It also ensures that the corrected data remains suitable for detailed analysis by geography and subgroup.

Application of Correction Factors

The correction factors are applied to the respondent-level data prior to the standard grossing weights. For Q4 2025, the adjustment is implemented by applying the inverse of the derived correction factors to the observed data as a **comparability adjustment**. This ensures that the distribution of trip takers and non-trip takers aligns with the expected proportions used to maintain continuity in the time series.

The factors are assigned based on the survey completion date recorded in the raw dataset, ensuring that responses are adjusted in line with the relevant fieldwork period. Where reporting periods span multiple fieldwork intervals, different factors may be applied within a single reporting month to reflect this timing. This approach ensures consistency between the calibration framework, fieldwork periods and the recall window, while maintaining the integrity of the resulting estimates.

Q4 2024 Comparability Adjustment Factors

To improve the precision of the factors, a regional approach to deriving the calibration factors was applied. The 11 regions include Scotland, Wales and the 9 England regions: North East, North West, Yorkshire and the Humber, East Midlands, West Midlands, East of England, London (Greater London), South East, South West.

Quarterly Correction factors at Region Level

Region at Q003	FIELDWORK Month	End Date Dates in raw data		
			Yes	No
Scotland	Oct-25	06/10/2025 - 09/11/2025	0.573	1.188
Scotland	Nov-25	10/11/2025 - 07/12/2025		
Scotland	Dec-25	08/12/2025 - 04/01/2026		
Scotland	Jan-26	05/01/2026 - 08/02/2026	0.577	1.189
Wales	Oct-25	06/10/2025 - 09/11/2025	0.607	1.154
Wales	Nov-25	10/11/2025 - 07/12/2025		
Wales	Dec-25	08/12/2025 - 04/01/2026		

Great Britain Tourism Survey: Overnight Trips 2025

Wales	Jan-26	05/01/2026 08/02/2026	-	0.576	1.177
North East	Oct-25	06/10/2025 09/11/2025	-	0.597	1.165
North East	Nov-25	10/11/2025 07/12/2025	-		
North East	Dec-25	08/12/2025 04/01/2026	-		
North East	Jan-26	05/01/2026 08/02/2026	-	0.574	1.150
North West	Oct-25	06/10/2025 09/11/2025	-	0.555	1.198

South West England	Jan-26	05/01/2026 08/02/2026	-	0.539	1.129

5 Quality Management

5.1 Quality assurance

In terms of the supplier for the research, the BMG Quality Management System (QMS) is integral to the BMG business and forms the cornerstone of all aspects of BMG service delivery. The QMS has been created from a number of industry recognised standards. All employees working on a project adhere to the MRS code of Conduct at all times. BMG adopts the tightest quality control processes and the standards under which these have been developed and to which BMG are recognised are listed below:

- ISO 9001; The International Standard for Organisational Quality;
- ISO 20252; The International Standard for Market Research;
- ISO 27001; The International Standard for Information Security Management;
- Cyber Essentials Plus certification;
- A Fair Data organisation;
- IQCS; The Interviewer Quality Control Scheme;
- The Data Protection Act;
- The Market Research Society Code of Conduct

A number of quality measures are implemented specifically for this survey. These include:

- Data validation elements built into the survey script
- During fieldwork, the following are closely measured:
 - Dropouts (respondents who abandon the survey before completing it) are tracked daily, ensuring any issues with the survey are identified immediately. Weekly monitoring and reporting is also completed on:
 - Demographics of dropouts
 - Dropout location i.e. which questions the respondent dropped out at
 - Completed interviews are tracked on a weekly basis by all quota demographics such as age x gender, region and social grade
 - Missing spend data and 'don't know'/'prefer not to say' responses for the international trips section are tracked weekly
- At the end of each fieldwork period, data is cleaned within the survey system. This cleaning process removes respondents in a number of situations where they are deemed to be 'bad quality':
 - Respondents who display straight lining behaviour, such as selecting the same response at questions where the same scale is used
 - Respondents displaying click through behaviour, such as selecting the first or last option at all or nearly all questions
 - Respondents displaying flatliner behaviour on open questions, such as only entering one character in open ended boxes, or selecting 'don't know' at all open ended questions
 - Respondents who have javascript disabled as this stops some elements of survey displaying correctly
 - Respondents who enter gibberish at open ended questions
 - Respondents who give contradictory age vs. education
- Data scrub reports are provided monthly i.e. speeders or other poor quality respondents are removed in the cleaning process, the reasons are tracked, as are the percentage of respondents who are removed and their demographics
 - Length of interview is monitored on a quarterly basis
 - Survey satisfaction. A voluntary free text question was added to the end of the questionnaire in the parallel run conducted in late 2025. This allowed respondents to provide feedback on the survey or survey experience and was applied to the live survey in January 2026.

- A series of quality checks on data exported from the survey system before data processing begins to ensure the data is as expected and for the correct period
- The use of data caps and imputations at data processing stage
- Quality checks on reports produced from the processed data, including any investigation of outliers

5.2 Quality assessment

Quality assessments are performed on most elements of the survey specific quality assurance process:

- It is not possible to quantitatively assess how well the data validation elements built into the survey script has performed. This is because they do not allow data that doesn't meet the validation points to be entered. As such, no data that does not meet the validation elements in the script was received.
- Survey cleaning took place for each reporting month. The proportion of removals at this stage are around 10%.
- It is not possible to give a quantitative assessment of the quality checks on exported data from the survey system as if any errors were found, the data was re-exported.
- A small number of caps and imputations were performed each month. More detail on these caps and imputations, including the number performed across the year can be found in section 4.5.1. The overall assessment of these caps and imputations are that they are within acceptable levels and only impact a small proportion of trips.
- The number of cases in each monitoring category are monitored each month to ensure that no weighting cells are empty. In 2025, no weighting cells were empty for any of the reporting months.
- It is not possible to give a quantitative assessment of quality checks on the reports produced as if an error was identified it was rectified. No consistent errors were found.

The statistical process was not subject to an internal peer review during the reporting period.

In 2021, the [Methodology Advisory Service \(MAS\)](#) of the Office for National Statistics were asked to provide methodological assurance of changes to methods introduced in 2020 for GBTS. There was particular interest in reviewing the survey representativeness and the use of correction factors and imputation. The review was not a formal assessment against the Code of Practice for Statistics.

The report made a number of recommendations and suggestions. A number of these recommendations and suggestions related to the reporting of information in this Background Quality Report. These have been actioned in this version of the report. The recommendations and suggestions also led to a number of specific analyses of data and the survey processes to be carried out. The results of these analyses are referred to in this document where appropriate and where the analysis has shown that improvements have been needed to the methods these have been implemented.

6. Relevance

6.1 User needs

In early 2020 a user needs session was convened with representatives from each of the National Tourism Organisations to better understand the users of the research, and how best to meet their needs regarding the research. The session focussed on the previous iteration of the survey (i.e. in 2019 and earlier), but it is not expected that users or their needs will differ considerably going forward.

13 user groups were identified in this session. These groups, and their identified needs are described in the table below:

User group	Description	Needs
National Tourism Organisations	The research and insight teams and other employees within the NTOs that have commissioned GBTS	To officially produce and publish official statistics. Use data for forecasting, strategic analysis, business planning and evaluation. The data from this survey is used alongside other survey and non-survey information to monitor performance of the visitor economy and to uncover insights into market trends over time.
National Tourism Organisations Internal stakeholders	Marketing, Business Development, and PR/Press teams within the National Tourism Organisations	Regular statistics to inform marketing and product development activities. Regular statistics and insights for publicity purposes and to respond to stakeholder requests for information.
Sponsoring Government departments	The government departments that sponsor the survey	Robust and reliable regular overnight trip statistics to inform economic impact, national and local accountancy and taxation and performance of the visitor economy
Eurostat	The EU statistical office, responsible for European tourism statistics	Annual tourism statistics in a pre-defined format to feed into database of European tourism statistics
Tourism/ industry trade bodies	Trade organisations that represent different elements of the tourism industry	General and sector specific statistics to support insight generation, strategic planning and monitoring industry performance and impacts.

User group	Description	Needs
Local Authorities	Local government departments responsible for the visitor economy	Tourism statistics at a local level to understand volume and value of local tourism
Individual ministers and elected representatives	Elected ministers and their research teams	Reliable information to feed into policy discussion, political briefings and government business
Enterprise agencies	Such as Historic England, Historic Scotland etc. Includes other non-departmental public bodies	Statistics at a local or sector specific level to support marketing and development activity and understand their user base
Tourism businesses	Businesses operating in the tourism sector, and their management organisations	Statistics to use for strategic business planning and to understand investment potential and market opportunities and needs.
Press and media	National and local media organisations	To report tourism performance and evidence stories being investigated
Consultants	Consultants operating in the tourism industry, or those in other industries that are consulting on tourism related matters	Information to support what they are consulting on
General public	Individual members of the public with an interest in tourism statistics	Easy to understand tourism statistics in a publicly accessible format
Data aggregators	Companies that take existing secondary data and package it into reports, such as Mintel	Reliable and robust data, published on a regular basis

6.2 User satisfaction

New questions added in 2021 in GBTS capture information on trips taken outside of the UK, more detailed information on activities undertaken, more detailed information on booking methods and timescales and enhanced information on respondent profiles, including protected characteristics. It is envisaged that this additional information will be of value for the various users of the surveys.

The National Tourism Organisations have already informed stakeholders, and users of the statistics, of plans for publishing 2025 data and publication of 2025 data. User needs will be considered at the appropriate stage.

6.3 Completeness

There are currently no specific relevant legislation, regulation or guidelines that are applicable to the survey.

However, in the past it was a requirement of European Commission regulation 692/2011 that specific tourism aggregated data was transmitted to Eurostat on an annual basis. The survey was designed to meet these requirements. Even though the data no longer needs to be submitted, the survey continues to use Eurostat definitions for what constitutes an overnight trip and follow Eurostat guidance on classifications such as type of place visited.

7. Accuracy and reliability

7.1 Overall accuracy

As the data is derived from a non-probability sample survey a quantitative assessment of accuracy is not possible. However, a qualitative assessment is provided below.

The main sources of potential accuracy error are predicted to be:

- Coverage error due to the use of an online panel methodology, meaning that the survey does not reach the part of the population that does not have online access
- Measurement error due to respondents entering incorrect values
- Non-response error due to the availability of don't know and prefer not to say options

7.2 Sampling error

GBTS is a quota sample, and so sampling error cannot be calculated. The results are projected from the sample to the population of interest (GB adults aged 16+).

Indicative confidence intervals were calculated using **SPSS Complex Samples**, applying a **design-based approach** that accounts for weighting and survey structure. Variance estimation is undertaken using **Taylor series linearisation**, a standard method for deriving robust standard errors for complex survey measures.

The confidence intervals assume that the weighted estimates are **approximately unbiased**, reflecting the effectiveness of the calibration and weighting processes in aligning the sample with the target population. As with all survey measures of precision, these intervals do not capture all potential sources of error and should be interpreted within the broader context of survey methodology⁴

⁴ [See American Association for Public Opinion Polling Guidance on Reporting Precision for Nonprobability Samples](#)

The GBTS data is weighted to correct for any imperfections in the achieved sample that might lead to bias and also to rectify any differences between the sample and the target population. More information on the weighting scheme is given in section 4.5.

The main risk of sampling bias lies in the possibility of differences in attitudes or behaviours of the online panel population, compared to the target population. This bias has three components:

- Differences between those who have online access compared to those who do not have online access
- Differences between those who join an online panel and those who do not join an online panel
- Differences between those who choose to complete the survey and those who do not

This bias is difficult to measure, and therefore, difficult to correct for. However, the first component of this bias is predicted to be very small, as 96% of all GB households had access to the internet in 2020⁵.

7.3 Non-sampling error

7.3.1 Coverage error

As a quota sample is used, in this case coverage error and sampling error are considered to be the same. Efforts to reduce this error include utilising a mix of panel partners to mitigate for possible panel specific biases, and keeping this panel mix consistent over time. Quotas are also derived from total population statistics, rather than based on panel population statistics to ensure no demographic groups are under-represented.

7.3.2 Measurement error

It is inevitable in any survey that there is a risk of measurement error due to incorrect values being entered. This error is predicted to be small in the case of GBTS, due to the steps taken to minimise this risk:

- The use of a self-completion survey, removing the risk of measurement error caused by interviewers mishearing or misunderstanding responses
- Detailed survey instructions that clearly tell each respondent what is needed from them at each question, with extra attention to more complicated questions, such as those which ask about spend
- Data validation built into the survey script, which automatically checks responses against those previously given where relevant
- A number of 'soft checks' that ask respondents to check unusual responses and amend them if necessary
- The provision of 'don't know' and 'prefer not to say options' so that a respondent can answer truthfully
- A carefully designed and tested survey and script, that automatically renders to different devices, optimising how each respondent views each question
- A dynamic survey set up that asks respondents about their trip taking behaviour in the four full weeks prior to the data of survey completion. This reduces the risk of recall being affected by the survey taking place considerably after the behaviour occurred

⁵ [internet access for households and individuals - ONS data - 2020](#)

7.3.3 Non-response error

Non-response error due to the availability of 'don't know' and 'prefer not to say' options is likely to be the largest potential source of error in the data collection. These options have deliberately been included to reduce measurement error, which typically has a bigger impact than non-response error on the resulting data. Questions which collect details about the amount spent on a trip are identified as having the largest risk of non-response error.

Measures to reduce the risk of non-response error include clear and detailed survey instructions. The imputations that take place at the data processing stage (described in section 4.5) help to reduce the impact of this error, but do not mitigate against it completely. The number of trips that have required imputations due to non-response will be carefully monitored and stated in the annual reports. They are also stated in this document in section 4.5.

7.3.4 Processing error

It is not expected that processing error will occur due to errors in the transformation of data into computer readable formats. This is because specially designed software is used to collect the data, which automatically stores the data in the necessary formats.

However, there is a risk of processing error in the form of the regular and ad-hoc reports produced from the survey data. If any errors are identified they will be documented in this report on an annual basis, as well as in the re-released version of the relevant reports, and in the annual report.

7.4 Data revision

7.4.1 Data revision – policy

Any possible data revisions would be unplanned.

In the event of a data revision being identified that impacts data in the public domain the following procedure will be followed:

- Need for the data revision is flagged to the National Tourism Organisations and or/ the data supplier as soon as possible
- A clear description of the data error is explained, including an assessment of the impact that this has had on the results
- The reports that are affected by the error are amended and re-released, including an explanation of the error and the impact that it has had

Each National Tourism Organisation also has their own procedure for handling data revisions. These can be found here:

- [VisitEngland](#)
- [VisitScotland](#)
- [Visit Wales](#)

7.4.2 Data revision – practice

There have been no data revisions to the 2025 GBTS: Overnight Trips data.

7.5 Seasonal adjustment

This section is not applicable as estimates are provided without seasonal adjustment. Trip taking behaviour has seasonal patterns and it is important for this to be evident in the estimations.

8. Timeliness and punctuality

8.1 Timeliness

Headline data reports for all months of 2025 are planned to be published in mid-2026.

Due to Q3 data uplift and Q4 2025 comparability adjustment, timelines were delayed.

Typically, under normal reporting timings, we would expect a time lag of 10-12 weeks from the end of each reference period to the publication date. This expected time lag is made up of:

- 4 weeks to finish data collection, due to the 4 weeks recall period
- 3-4 weeks for data processing and reporting
 - Varies by nation, typically 2-5 weeks for quality assurance and official publishing processes for the National Tourism Organisations

The 2025 overnight trips statistics were reported on a quarterly level for Scotland and Wales and monthly level for England.

8.2 Punctuality

VisitEngland pre-announce all 2025 publication dates on their website and the DCMS calendar. Visit Wales announce publication dates at least four weeks in advance and aim to announce the month of publication six months in advance on the Welsh Government's Statistics and Research calendar. VisitScotland did not make any announcements or provide a publication schedule for 2025.

9. Coherence and comparability

9.1 Geographical comparability

Geography in terms of the place of residence, place of visit origin and place of visit destination are all derived from respondent defined fields within the survey. For all of these measures the respondent is asked to select a place from a gazetteer of villages, towns and cities in the UK. Subsequent classifications for local authority, region and country are all derived from this selection.

As these measures are selected by each respondent there is a small risk that an incorrect place could be selected. However, all appropriate steps possible are taken to reduce this risk.

The gazetteer was built specifically for the new combined GBTS survey. Its starting point was an annually updated gazetteer produced by the Office for National Statistics⁶. Several changes were made to this list to ensure that the coverage was as complete as possible and as simple as possible for respondents to use:

- Places in Northern Ireland were added using a combination of a gazetteer produced by OSNI⁷ and a list built by comprehensive internet searches
- Duplicate places were removed to avoid respondent confusion. Where places have more than one commonly used spelling or name each commonly used instance was left in the list to allow respondents to select the name that they are most familiar with
- Local authority name was appended to each place name in parenthesis, e.g. Edgbaston (Birmingham) to reduce the risk of respondents selecting incorrect places, particularly where multiple places with the same name exist
- National parks were added into the list as places in their own right. This allows respondents to indicate that they visited a national park, even if they do not know the name of the nearest city, town or village to where they visited
- Additional classification information was appended to the gazetteer to allow all of the necessary analysis and reporting breakdowns, e.g. NUTS classification, urban/rural classification

In 2025, a review of the Gazetteer was conducted to reduce the number of locations a respondent could choose from. Base sizes only allow for statistics to be provided at County, Local Authority, LVEP and Top Town level. A significant proportion of the locations in the Gazetteer referenced very small areas, meaning that there were many duplicates in location name across the country and across nations. This duplication could cause confusion among respondents trying to choose the correct location.

Each nation utilised a verified location list and these were mapped to the current Gazetteer.

⁶ [ArcGIS Hub](#) An ArcGis login is needed to access the data

⁷ [OSNI - Open Data \(arcgis.com\)](#)

VisitEngland and VisitScotland utilised the [House of Commons City and Town Classification of Constituencies and Local Authorities](#), with some adjustments, for example, to the Scottish Island or London Local Authorities.

Visit Wales utilised a location list provided by the [Welsh Language Commissioner](#), which aligned well with the current Gazetteer. Some removals and adjustments were applied i.e. if the location was very small, such as a small road or park.

Locations never chosen in the original Gazetteer between 2022 and 2025 were excluded from the new location list.

The process of development consisted of a number of rounds of cognitive testing and parallel runs of the survey.

Final changes also included a nation filter, to support further reduction of the location list options provided to respondents. A number of JavaScript updates were also implemented to reduce dropouts and improve functionality of the survey.

The final location list, which went live in the GBTS survey in January 2026, contains the following number of locations in each nation:

- England: 6,684
- Scotland: 1,586
- Wales: 4,177
- Northern Ireland: 209

The main limitation on comparing results across different regions or other geographical entities is the number of responses collected for that area in any given month. Where the number is very small the level of accuracy of results is greatly reduced and subject to greater variability. This is particularly pertinent when looking at results for Scotland or Wales, or smaller regions, such as local authorities, or national parks. As such, it is recommended that results for Scotland, Wales and regions of England are analysed at either a quarterly, 12 month or year to date level. In some cases (most notably local authority level), results are analysed across 2 to 3 years.

In terms of comparison of the UK with other European countries, the survey is deliberately designed so that results are comparable with other countries' data collected through Eurostat. The latest Eurostat guidelines⁸ have been followed in terms of how a visit is defined and how the data is structured.

⁸ [Methodological manual for tourism statistics - Version 3.1 - 2014 edition - Products Manuals and Guidelines - Eurostat \(europa.eu\)](#)

9.2 Comparability over time

GBTS (focussed on overnight trips) has been running on a regular basis, in some form, since 1989. However, for the Great Britain Tourism Survey (covering both overnight trips and day visits), from 2021 onwards it was agreed that a number of changes would be made. These changes include:

1. Moving to an online-panel non-probability methodology from a face-to-face non-probability methodology used for GBTS
2. A change in the definition of what classes as a qualifying overnight trip – previously all trips, no matter their frequency or whether they were outside of the respondents' usual environment had been included
3. Amends to the list of activities undertaken
4. Change in how regularity of the trip is measured
5. Change in how 'outside of usual environment' is defined
6. A simplification to the weighting criteria
7. A move from manual imputations to an automated process based on firm rules

This, together with the interruption in data collection due to COVID-19, meaning data was not collected for the first 3 months of 2021, means that results are not directly comparable to published data for 2019 and preceding years. Furthermore, in 2019 and previously, only adult volumes were reported, whereas from 2021 onwards combined adult and child volumes are reported. This means that estimations of visit volume from 2021 onwards should not be compared with 2019 and earlier years.

Following a methodological review in 2024, the 2022 and 2023 data was re-processed and the 2024 and 2025 data utilised the new methodology. Data for 2021 is not published as due to COVID pandemic lockdowns the complete calendar year data is not available.

Considering the range of changes made, post 2019, the data from 2022 are not directly comparable to 2019 and earlier years.

9.3 Coherence – cross domain

The only area of possible cross-domain coherence is with the International Passenger Survey (IPS). Prior to 2024, the surveys were not directly comparable due to differences in data collection methods; while GBTS uses online data collection and aims to be representative of the GB population, the IPS used face-to-face data collection at UK major air, sea and tunnel ports and only surveys those travelling through these ports.

IPS outbound questions were added to the GBTS in October 2023 for testing purposes and fully launched in 2024. At present, if the IPS data is published, it is referenced in annual or quarterly reporting, to help provide the full picture of GB residents tourism trends.

9.4 Coherence – internal

This section is not applicable.

10. Accessibility and clarity

10.1 News release

At the time of writing this report, no news releases had been published relating to the full year 2025 data.

10.2 Publication

Publication of headline results (including quarterly and year to date figures) is released quarterly. Detailed annual results are published when available following the quarter four release.

10.3 Online databases

At the time of writing this report, the public viewer for the 2025 data are published by VisitEngland. No other National Tourism Organisations have published any databases.

10.4 Micro-data access

There are no plans to make 2025 data available in micro-data form. Micro-data form is respondent and trip level information, with all personally identifiable information removed.

10.5 Other

All National Tourism Organisations regularly present and disseminate findings. Findings can be found on each National Tourism Organisations website.

- [Visit England](#)
- [VisitScotland](#)
- [Visit Wales](#)

10.6 Documentation on methodology

This report is the main documentation on the methodology for 2025 data.

10.7 Quality documentation

This report contains the main quality documentation for the 2025 data. This information can be found in sections 5.1 and 5.2.

11. Cost and burden

11.1 Cost

The management of the costs is shared amongst Office of National Statistics (ONS), VisitEngland, Visit Wales and VisitScotland. Initial costs savings have been recognised by combining parts of the surveys in the online methodology approach – with respondents routed to either overnight trips or day visits surveys where more detailed data is captured. This approach offers more efficiency and agility, for example questionnaire changes can be implemented quickly and efficiently compared to the face-to-face methodology.

11.2 Burden

The average time taken to complete the GBTS survey is 13 minutes and 25 seconds. Over the course of 2025, 63,028 GBTS surveys were completed. The total respondent burden in terms of time was 13,241 hours.

It is worth noting that as the survey data is collected via an online survey it is possible for respondents to leave the survey page open for a period of time even though they are not interacting with it. The average time measures the entire time that the survey was open, irrespective of whether respondents were actively engaging with it for all of that time or not. Therefore, the real time burden is likely to be a little lower.

The following measures have been implemented to reduce respondent burden:

- The survey is device agnostic and automatically renders to different devices, so the layout is optimised for screen size
- A comprehensive review of the questionnaire was undertaken when the contract was taken over by the current agency to identify and remove or amend any unnecessary questions
- Automatic routing is built into the survey so that respondents do not see questions that they do not need to answer
- Respondents are only asked to give detailed information about ‘qualifying’ overnight trips – i.e. those that meet the eligibility criteria
- The number of qualifying overnight trips that a respondent is asked detailed questions about is capped at 3
- The survey layout is specifically designed to be clear and simple to follow, as is the survey language
- Respondent instructions are clear and kept to a minimum
- The survey is available in Welsh for respondents who speak Welsh as a first language
- The survey software supports the use of screen readers for people with sensory impairments
- Respondents are compensated for their time in the form of panel incentives (this differs by panel, but is typically in the form of points that can be redeemed for cash or vouchers)

Dropout rates were monitored in detail during the pilot and are monitored weekly by BMG. They do not signal that any particular part of the questionnaire is challenging. The vast majority of drop outs during the pilot stage occurred at the introduction screen, which is a normal occurrence for online panel surveys, and reflects respondents changing their mind about wishing to do the survey.

12. Confidentiality

12.1 Confidentiality – policy

Publication of all data from GBTS is at an aggregate level. However, there is still national legislation that is applicable in terms of data confidentiality. These are:

- Data Protection Act 2018
- UK General Data Protection Regulation
- The Market Research Society Code of Conduct

Respondents are assured that the information that they provide will be treated as confidential and that no individual responses will be publicly disclosed. Due to the online panel methodology of the GBTS, no personally identifying information is collected as part of the survey (such as respondent names, email addresses or full postal addresses). The survey does, however, collect personal information, some of which is sensitive personal information by asking demographic questions.

For the purposes of GDPR the survey sponsors (ONS, VisitEngland, VisitScotland and Visit Wales) are the data controllers. BMG and Qualtrics are data processors.

12.2 Confidentiality – data treatment

All cells where there are fewer than 5 trips will be suppressed in all public reports. This includes monthly and annual reports, as well as the online data viewer.

13. Sample Base Sizes

13.1 Number of trips 2025 estimations are based upon.

Although the annual sample target is 60,000 respondents for GBTS: Overnight Trips, not all respondents take an overnight trip in the reference period they are asked about. Furthermore, some respondents take more than one trip in the period asked about. The tables below have been provided to help users understand the number of trips that estimations for 2025 are based on. It should be noted that it is possible for a trip to visit more than one nation, so the sum of trips to England, Scotland and Wales is typically higher than the count of trips to GB. It also

possible for a trip to not have a region assigned to main place visited, so the sum of the regions will not always match that for the country.

Country visited	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total

See details in Section 4.6.2 Comparability Adjustment for details on why there was an increase in base sizes September to December 2025.

13.2 Description of appendices

The appendix of this report includes a short summary of changes in methodology, data collection and technical adjustments, as well as the full questionnaire, which is a combined GBTS Overnight Trips and Day Visits survey. Also included in the appendix is the statement of terms of the organisation that administers the survey.

14. Appendix: Summary of Changes

Change	Date / Timing
Integration of Day Visits and Overnight Trips surveys into a single GBTS framework, improving consistency in data collection and reporting	2020
Introduction of revised methodology following COVID-19 disruption, with 2020 treated as a pilot year	2020
Simplification of weighting approach to improve efficiency, stability, and accuracy of estimates	Implemented in current GBTS methodology
Transition to “statistics in development” classification and resulting non-comparability with pre-2019 data	From 2022 onward
Initial introduction of caps to manage outliers in volume, nights, and expenditure data	2022
Updates to sampling approach, including panel replacements and improvements to reach underrepresented groups	2021–2023
Transition to an aggregated panel model for sample delivery	September 2024
Comprehensive methodological review, including refinement and expansion of capping rules	July 2024
Reprocessing of 2022–2023 data using updated methodology and application to all subsequent datasets	From 2024 onward
Introduction of enhanced capping approach, including dynamic (average) capping to better manage volatility	2024
Introduction of calibration to offset the impact of capping and maintain consistency with pre-review estimates	2024 (applied to 2022–2025 data)
Revision to reporting methodology to assign trips to calendar months based on trip end date	From 2024 onward
Ongoing inflationary adjustments to spend caps to reflect changing price levels	2023–2025
Introduction of uplift adjustments to compensate for data loss due to survey scripting issues	Q3 2025
Introduction of comparability adjustments to correct for survey completion bias and maintain time-series consistency	Q4 2025

15. Appendix: Questionnaire

Thank you for agreeing to take part in this survey. We hope you will find it interesting.

The survey is about holidays and day trips you've taken recently. It's on behalf of several public bodies and what you tell us will be used to measure UK tourism and shape the industry. The names of the commissioning public bodies are available at the end of the survey.

The survey takes around 15 minutes to complete.

Click the button (→) below to start the survey.

Enjoy the survey!

Data Protection Notices

Your responses will be treated in the strictest confidence. BMG Research abides by the Market Research Society Code of Conduct at all times. We will protect the confidentiality of your information in accordance with our normal data handling procedures and all legal requirements. We will not use it for any purposes other than those which are set out in the survey.

You can find out more information about our surveys and what we do with the information we collect in our Privacy Notice which is here www.bmgresearch.co.uk/privacy

16. Appendix: Statement of Terms

Compliance with International Standards

BMG complies with the International Standard for Quality Management Systems requirements (ISO 9001:2015) and the International Standard for Market, opinion, and social research service requirements (ISO 20252:2012) and The International Standard for Information Security Management (ISO 27001:2013).

Interpretation and publication of results

The interpretation of the results as reported in this document pertain to the research problem and are supported by the empirical findings of this research project and, where applicable, by other data. These interpretations and recommendations are based on empirical findings and are distinguishable from personal views and opinions.

BMG will not publish any part of these results without the written and informed consent of the client.

Ethical practice

BMG promotes ethical practice in research: We conduct our work responsibly and in light of the legal and moral codes of society.

We have a responsibility to maintain high scientific standards in the methods employed in the collection and dissemination of data, in the impartial assessment and dissemination of findings and in the maintenance of standards commensurate with professional integrity.

We recognise we have a duty of care to all those undertaking and participating in research and strive to protect subjects from undue harm arising as a consequence of their participation in research. This requires that subjects' participation should be as fully informed as possible and no group should be disadvantaged by routinely being excluded from consideration. All adequate steps shall be taken by both agency and client to ensure that the identity of each respondent participating in the research is protected.
